ArchiMate Assessment Criteria & Review Guide

Evaluation Areas & Weighting:

Area	What is assessed?	%	Rating Criteria
Meta-model and relationships	Correct use of concepts, layers and relationships according to Archimate 3.2 specification Understanding and application of derivations and specialisation	30	**Poor** : Use incorrect or invalid elements/layer and relationships. No cross-layer connections **Average** : Mostly correct elements, but with minor mistakes in relationships (Eg. using association instead of serving), Mostly valid cross -layer connections **Outstanding** : Precise appliciation of metamodel, relationships and valid cross-layer connections
Scenario Interpretations and Completeness	Interpret a scenario and create a complete, accurate ArchiMate modee	20	**Poor :** Misinterpret or ignore key elements from the sceanrio. **Average :** Captures the main elements, but doesn't reflect the details correctly. **Outstanding**: Fully covers all scenario details including dependencies , triggers and constraints
Viewpoints and Stakeholder Relevance	Proper selection of viewpoints (Stakeholder, Capability etc)	25	Poor : Choose inappropriate views for the architect role Average : Viewpoints are acceptable but not best fit Outstanding : Select the most effective viewpoints to communicate

	Alignment of models with stakeholders concerns		scenario needs
Cross layer Alignment	Logical connections between layers (Motivations→ Strategy→ Business->Application->Technology ->Implementation) Model baselin to target architecture Clarity	25	Poor: Weak or missing cross-layer connections Average: Basic traceability is present Outstanding : String E2E traceability with clear vertical and horizontal alignment
Clarity	Visual simplicity and readability - No clutter , grouping and alignment , no or minimal crossings	10	Poor : Disorganised model (mislabelled, overly cluttered, annotations, legends missing Average : Model is understandable, but requires efforts to interpret, visuals are adequate, but not optimised for readability Outstanding : All elements are defined clearly, well labelled and logically organised, annotations, legends, notes are complete

Key Reviewer Prompts:

1. **Traceability:** Can each business goal be traced to specific capabilities, services, and technical components?
2. **Completeness:** Has the candidate covered all relevant aspects of the scenario, from strategy to deployment, without major omissions?
3. **Model Validity:** Are all relationships valid within ArchiMate's rules? Are all elements in their appropriate layer?

4. **Stakeholder Fit:** Do the views align with stakeholder concerns, and would they effectively communicate the architecture to the intended audience?
5. **Visual Quality:** Are the diagrams easy to read, logically organized, and free from overlapping or ambiguous relationships?
6. **Cross-layer Integration:** Is there a visible and logical alignment between business processes, application services, and technology components?
7. **Use of Viewpoints:** Has the candidate applied the appropriate viewpoints (e.g., layered view, application collaboration, motivation) for the purpose of the model?
8. **Consistency:** Is notation used consistently across all views? Are naming conventions applied uniformly?
9. Automated validation by using BizzDesign to validate syntax and modelling errors
10. Manual Review using the assessment criteria
11. Collaborative Review by conducting a short joint session to clarify findings, if needed
